

## Website Analytics

How do I see my site statistics?

Host 17 uses a program called Webalizer to parse data from your raw Web server logs and present the data in a method that is easier to understand and analyze. This data can tell you information about your Website such as how many people have visited your site in a particular month, what pages of your site were visited most frequently, how people typically found your site (i.e. search engine, link from friend's site) and what area visitors come from.

To access Webalizer for your site, point your browser to <http://www.yourdomain.com/stats>. You will be prompted for a username and password. Use the one's provided in your Welcome Letter.

Once you have entered the proper username/password combination, the summary screen will be displayed.

Statistics for your Website are listed by month. [Click here](#) for a key that explains the colors and terms used. You can obtain more detailed information by week, day and hour by clicking on the desired month.

For those who are new to Web Analytics, please read the [Simpletons Guide to Web Server Analysis](#).
